Appendix D: Legal notice	147

■ About this manual

Please make sure to read through this user manual before your first use and follow the instructions herein when you operate the product. Failure to comply with the instructions may result in product damage, property loss, personal injuries, and/or a breach of warranty.

Access to this manual

To obtain the latest version, please do one of the following:

- Visit the Download page of Hesai's official website: <https://www.hesaitech.com/downloads/>
- Contact your sales representative of Hesai.
- Contact Hesai technical support at service@hesaitech.com.

Technical support

If your question is not addressed in this user manual, please contact us at:

- service@hesaitech.com
- <https://www.hesaitech.com/technical-support/>
- <https://github.com/HesaiTechnology>

Legends and format

Warnings: Instructions that must be followed to ensure safe and proper use of the product.

Notes: Additional information that may be helpful.

Names of data fields are in monospace font.

For example: **Distance** represents the Distance field.

■ Safety notice

- Please make sure to read through this safety notice and follow all the instructions and warnings. Failure to comply with the instructions and warnings may result in product damage, property loss, and/or personal injuries.
- Please check the certification information on the product's nameplate. If an agreement has been made not to present certification information on the nameplate, please follow the agreed-to arrangements.
- If you incorporate this lidar product into your product(s), you are required to provide this user manual (or access to this user manual) to the intended users of your product(s).
- This lidar product is intended as a component of an end product. The end-product supplier is responsible for assessing the risk of use in accordance with applicable standards and informing the intended user of safety-related information.
- Should there be other agreements with specific users, the other agreements shall apply.
- Before using a product, please confirm with Hesai the development maturity of the product in a timely manner. For products still in development, Hesai makes no warranty of non-infringement nor assumes any responsibility for quality assurance.

Special warnings

Laser safety

Hot surface

Hot parts!

Burned fingers when handling the parts.

Wait one-half hour after switching off before handling the parts.

Abnormalities

In any of the circumstances listed below, stop using the product immediately:

- If you suspect malfunctions of or damage to the product, with symptoms such as noticeable noise or vibration.
- If you or people in the nearby environment feel discomfort.
- If any device or equipment in the nearby environment malfunctions.

Meanwhile, contact Hesai or an authorized Hesai service provider for more information on product disposal.

Prohibition of disassembly

Unless expressly agreed to in writing by Hesai, do NOT disassemble the product.

Operating environment

Radio frequency (RF) interference

- Before using the product, make sure to read all the signs and notices on the product enclosure (including the nameplate). If specific users require not presenting certification information on the nameplate, please follow the agreed-to arrangements.
- Although the product is designed, tested, and manufactured to comply with the regulations on RF radiation (such as FCC, CE-EMC, or KCC), the radiation from the product may still influence electronic devices.

Vibration

- If significant mechanical shocks and vibration exist in the product's operating environment, please contact Hesai's technical support to obtain the shock and vibration limits of your product model. Exposure to over-the-limit shocks or vibration may damage the product.
- Make sure to package the product in shock-proof materials to avoid damage during transport.

Explosive atmosphere and other air conditions

- Do NOT use the product in any area where a potentially explosive atmosphere is present, such as where the air contains high concentrations of flammable chemicals, vapors, or particulates (including particles, dust, and metal powder).
- Do NOT expose the product to environments that have high concentrations of industrial chemicals, including liquefied gases that are easily vaporized (such as helium). Such exposure can damage or impair product functionality.

Chemical environment

Do NOT expose the product to corrosive or strong polar chemical environments (such as liquids or gases), including but not limited to strong acids, strong bases, esters, and ethers. This is to avoid damage to the product (including but not limited to water resistance failure).

Ingress protection (IP)

Please check the product's user manual for its IP rating (refer to [Section 1.5 Specifications](#)). Make sure to avoid any ingress beyond that rating.

Operating temperature

Please check the product's user manual for its operating temperature (refer to [Section 1.5 Specifications](#)). Make sure not to exceed the operating temperature range.

Recommended storage conditions

Please store the product in a dry and well-ventilated place. The recommended ambient temperature is $23 \pm 5^{\circ}\text{C}$, with relative humidity between 30% and 70% RH.

Light interference

Certain precision optical instruments may interfere with the laser light emitted from the product. Please check all the instructions for these instruments and take preventive measures if necessary. For example, protective leather covers are provided for certain product models; when these lidars are temporarily not used for measurement, the leather covers can be applied to block laser light emission.

Personnel

Recommended operator qualifications

The product should be operated by professionals with an engineering background or experience in operating optical, electrical, and mechanical instruments. Always follow the instructions in this manual throughout operation. If needed, please contact Hesai for technical support.

Medical device interference

- Some components in the product can emit electromagnetic fields. If the product operators or people in the nearby environment wear medical devices (such as cochlear implants, implanted pacemakers, and defibrillators), make sure to consult the physicians and medical device manufacturers for medical advice, such as determining whether a safe distance from the product is required.
- If you suspect that the product is interfering with your medical device, stop using the product immediately.

Installation and operation

Power supply

- Before powering on the product, make sure the electrical interfaces are dry and clean. Do NOT power on the product in a humid environment.
- Do NOT use damaged or out-of-spec cables or adapters.
- You are recommended to use only the cables and power adapters provided by Hesai. If you are to design, configure, or select the power supply system (including cables) for the product, make sure to comply with the electrical specifications in the product's user manual (refer to [Section 1.5 Specifications](#) and the Power Supply Requirements section if available); for technical support, please contact Hesai.
- Please check [Section 2.2 Electrical interface](#) and strictly follow the instructions on plugging/unplugging the connector. If abnormalities already exist (such as bent pins, broken cables, and loose threads), stop using the product and contact Hesai technical support.

Eye safety

The product is a Class 1 laser product. It satisfies the requirements of:

- IEC 60825-1:2014
- EN 60825-1:2014+A11:2021
- 21 CFR 1040.10 and 1040.11 except for deviations (IEC 60825-1 Ed.3) pursuant to Laser Notice No.56, dated May 8, 2019.

CAUTION: Use of controls or adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposure.

CAUTION

- For maximum self-protection, it is strongly warned that users do NOT look into the transmitting laser through a magnifying product (microscope, eye loupe, magnifying glass, etc.).
- This product does not have a power switch. It starts operating once connected to power. During operation, the entire cover lens can be regarded as the product's laser emitting window; looking at the cover lens can be regarded as looking into transmitting laser.

Product enclosure

- Do NOT crush or puncture the product. If the product enclosure is broken, stop using it immediately and contact Hesai technical support.
- Certain product models contain high-speed rotating parts. To avoid potential injuries, do NOT operate the product if the enclosure is loose.
- If the product enclosure consists of fins or grooves, please wear gloves when handling the product. Applying too much pressure with your bare hands may cause cuts, bruises or other injuries.

Drops and burns

The product contains metal, glass, and plastic, as well as sensitive electronic components. If the product is dropped or burnt, stop using it immediately and contact Hesai technical support.

Cover lens

The location of the cover lens is illustrated in [Section 1 Introduction](#).

- Do NOT apply protective film, wax or any other substance on the cover lens.
- To keep the product's cover lens from fingerprints and other stains, do NOT touch the cover lens with bare hands. If the cover lens is already stained, please refer to the cleaning method in [Section 5 Maintenance](#).
- To prevent scratches, do NOT touch the product's cover lens with hard or sharp objects. If scratches already exist, stop using the product and contact Hesai technical support. Severe scratches may affect the quality of the product's point cloud data.

Mounting

- Before operating the product, make sure it is properly and securely mounted. The mounting should prevent the product from leaving its mounting position under external forces (such as collisions, high winds, and stone impacts).
- Before installing any exterior part, please ensure that each exterior part and its movable area do not overlap the Field of View (FOV) of the lidar.

The FOV of lidar is the spatial angular range bounded by the horizontal and vertical FOV ranges (see [Section 1.5 Specifications](#)); the distance to the origin of the lidar's coordinate system is not limited. For inquiries about the FOV, please contact Hesai technical support.

Hot surface

During operation or the time period after the operation, the product's enclosure can be hot.

- To prevent discomfort or even burns, do NOT touch the product's enclosure with your skin.
- To prevent fires, make sure to keep flammable materials away from the product's enclosure.

Certain product models support active heating of the cover lens to reduce the impact of ice and frost.

- While active heating is ON, the cover lens can be hot. To prevent discomfort or even burns, avoid direct skin contact with the cover lens.
- When the cover lens is free of ice and frost, you may turn off active heating.

Peripherals

The product may be used along with accessories and devices, such as suction cup mounts, extension cables, power supplies, network devices, GNSS/PTP devices, CAN transceivers, and cleaning equipment.

When selecting a peripheral, please refer to all relevant specifications in the product's user manual or contact Hesai technical support. Using out-of-spec or unsuitable devices may result in product damage or even personal injuries.

Firmware and software upgrading

Make sure to use only the upgrade files provided by Hesai. Make sure to observe all the instructions provided for that upgrade file.

Customized firmware and software

- Before using a customized version of firmware and software, please fully understand the differences in functions and performance between the customized version and the standard version.
- Make sure to strictly follow all the instructions and safety precautions provided for that customized version. If the product does not function as anticipated, stop using the product immediately and contact Hesai technical support.

Point cloud data processing

- Certain product models support one or more point cloud data processing functions, including but not limited to: Noise Filtering, Interstitial Points Filtering, Retro Multi-Reflection Filtering, and Non-Linear Reflectivity Mapping.
- These functions are configurable and are intended only to assist the user in extracting information from the point cloud data. Users are in full control of whether to use any of these functions. Moreover, users are responsible for analyzing the product's intended application scenarios and evaluating the risk of enabling one or more of these functions in combination.
- To learn about the supported functions of a product model, please contact Hesai technical support.

Repair

- Unless expressly agreed to in writing by Hesai, do NOT disassemble, repair, modify, or alter the product by yourself or through any third party. Such a breach:
 - can result in product damage (including but not limited to water resistance failure), property loss, and/or injuries;
 - shall constitute a breach of warranty.
- For more product repair issues, please contact Hesai or an authorized Hesai service provider.

1. Introduction

1.1. Applicability

This manual applies to the following versions:

Software	1.45.127 or later
Firmware of Sensor	1.45.141 or later
Firmware of Controller	1.45.130 or later

1.2. Operating principle

Distance measurement: Time of Flight (ToF)

1. A laser diode emits a beam of ultrashort laser pulses onto the target object.
2. The laser pulses are reflected after hitting the target object. The returning beam is detected by an optical sensor.
3. Distance to the object can be accurately measured by calculating the time between laser emission and receipt.

$$d = \frac{ct}{2}$$

d: Distance

c: Speed of light

t: Travel time of the laser beam

1.3. Basic structure

The basic structure is shown in [Figure 1](#).

Multiple pairs of laser emitters and receivers are attached to a motor that rotates 360° horizontally.

Figure 1. Partial cross-sectional diagram

Figure 2. Coordinate system (isometric view)

Figure 3. Lidar azimuthal position (top view)

The lidar's coordinate system is illustrated in [Figure 2](#).

- Z-axis is the axis of rotation.
- The origin's exact position is shown as a red dot in [Figure 5](#). All measurements are relative to the origin.

The lidar's azimuthal position is defined in [Figure 3](#).

- By default, the lidar rotates clockwise in the top view. To select counterclockwise rotation, use either Web Control or PTC commands.
- Y-axis corresponds to 0° .
- Each laser channel has an intrinsic azimuth offset. Channel 42 is selected to define the lidar's azimuthal position.

For example, when Channel 42 passes the 90° position, the lidar is at the 90° position; the azimuth of the corresponding data block in the Point Cloud Data Packet is 90° .

1.4. Channel distribution

All channels are unevenly distributed, as illustrated in [Figure 4](#).

- Vertical resolution: See [Section 1.5 Specifications](#).
- The design values of each channel's angular position: See [Appendix A Channel distribution data](#).
- Channel number counts from 1, top to bottom.

Figure 4. Channel vertical distribution

Figure 5. Laser firing position (unit: mm)

Each channel has an intrinsic angle offset, both horizontally and vertically. These angles are recorded in the angle correction file of this lidar, which is provided when shipping.

Get the angle correction file

Use one of these ways:

- Send PTC command 0x05; see the TCP API Reference Manual.
- Export the file using PandarView 2; see the PandarView 2 User Manual.
- Ask Hesai technical support or your sales representative.

1.5. Specifications

SENSOR

Scanning method	Mechanical rotation
Number of channels	128
Ranging capability ①	0.3 to 200 m (at 10% reflectivity)
Ranging accuracy ②	±8 cm (0.3 to 0.5 m, each channel) ±5 cm (0.5 to 1 m, each channel) ±2 cm (1 to 200 m, average)
Horizontal FOV	360°
Horizontal resolution ③	Configurable on-the-fly 0.1°/0.2° (10 Hz) 0.2°/0.4° (20 Hz)
Vertical FOV	40° (-25° to +15°)
Vertical resolution	0.125° (Channels 26 to 90) 0.5° (Channels 2 to 26, 90 to 127) 1° (Channels 1 to 2, 127 to 128)
Frame rate	10 Hz, 20 Hz
Return mode	Single Return: Last/Strongest/First Dual Return: Last and Strongest, Last and First, First and Strongest

MECHANICAL/ELECTRICAL/OPERATIONAL

Wavelength	905 nm
Laser class	Class 1 Eye Safe

Ingress protection	IP6K7 & IP6K9K
Dimensions	Height: 123.7 mm Top/Bottom: Φ 118.0/116.0 mm
Rated voltage range	DC 9 to 48 V
Power consumption ④	27 W (High Resolution mode) 23 W (Standard mode)
Operating temperature	-40°C to 85°C
Storage temperature	-40°C to 85°C
Weight	1.63 kg

DATA I/O

Data transmission	Standard 1000BASE-T or automotive 1000BASE-T1, slave mode
Measurements	Distance, azimuth angle, and reflectivity
Valid point rate	Single Return: 3 456 000 pts/sec (max) Dual Return: 6 912 000 pts/sec (max)
Point cloud data rate	Single Return: 135.22 Mbps (max) Dual Return: 270.44 Mbps (max)
Clock source	GNSS/PTP (1588v2, 802.1AS, 802.1AS Automotive)
PTP clock accuracy	$\leq 1 \mu\text{s}$
PTP clock drift ⑤	$\leq 1 \mu\text{s/s}$

Specifications are subject to change. Please refer to the latest version of this manual.

Notes to specifications

- | | |
|--------------------------------|--|
| ① Ranging capability | <ul style="list-style-type: none">• Measured under 100 klux ambient illuminance.• The ranging capability of each channel is listed in Appendix A Channel distribution data. |
| ② Ranging accuracy | May vary with range, temperature, and target reflectivity. |
| ③ Horizontal resolution | The data of each channel is in Appendix A Channel distribution data . |
| ④ Power consumption | <ul style="list-style-type: none">• Measured under 10 Hz frame rate.• Not including accessories such as the connection box.• High Resolution and Standard modes: See Section 4.4 High Resolution.• The external power supply should be able to provide at least 27 W. |
| ⑤ PTP clock drift | Defined as the drift at a constant temperature after the lidar (slave clock) loses connection to the PTP master. |

2. Setup

Before operating the lidar, strip away the protective cover on the cover lens.

2.1. Mechanical installation

2.1.1. Exterior dimensions

Figure 6. Front view (unit: mm)

Figure 7. Bottom view (unit: mm)

2.1.2. Quick installation

Figure 8. Quick installation

2.1.3. Stable installation

Figure 9. Stable installation

2.1.4. Notes on screw installation

Screw type

SEMS screws (with pre-attached flat washers and lock washers) are recommended. Property class should be at least 4.8.

Screw torque

The base material of the threaded holes is aluminum alloy instead of steel. Refer to the following table for the appropriate screw torque.

Thread size	Recommended screw torque
M2	0.2 to 0.3 Nm
M3	0.5 to 0.6 Nm
M4	1 to 1.5 Nm
M5	2 to 2.5 Nm
M6	3 to 3.5 Nm

Thread service life

- Ten times. (Each screwing counts as one time, so as each unscrewing.)
- If threadlocker is used, clean the threaded hole before each retightening. Avoid contact between the cover lens and the cleaner.

2.2. Electrical interface

Lemo part number: EEG.2T.316.CLN (female socket, on the lidar)

Figure 10. Lemo connector (female socket)

2.2.1. Pin description

Standard 1000BASE-T

No.	Signal	Voltage	Wire color
1	Ground (return)	0 V	Black
2	Ground (return)	0 V	White
3	Ethernet BI_DC-	-1 to 1 V	Blue
4	Ethernet BI_DC+	-1 to 1 V	Blue/White
5	Ethernet BI_DB-	-1 to 1 V	Green
6	Ethernet BI_DB+	-1 to 1 V	Green/White
7	Ethernet BI_DA-	-1 to 1 V	Orange
8	Ethernet BI_DA+	-1 to 1 V	Orange/White
9	GNSS NMEA	-13 to 13 V	Yellow
10	Power	9 to 48 V	Red
11	Power	9 to 48 V	Green
12	GNSS PPS	3.3/5 V	Purple
13	Ethernet BI_DD-	-1 to 1 V	Brown
14	Ethernet BI_DD+	-1 to 1 V	Brown/White
15	Index	0 to 3.3 V	Gray
16	Encoder	0 to 3.3 V	Gray/White

Automotive 1000BASE-T1

No.	Signal	Voltage	Wire color
1	Ground (return)	0 V	Black
2	Ground (return)	0 V	White
3	Ethernet_Data-	-1 to 1 V	Blue
4	Ethernet_Data+	-1 to 1 V	Blue/White
5 to 8	—	—	—
9	GNSS NMEA	-13 to 13 V	Yellow
10	Power	9 to 48 V	Red
11	Power	9 to 48 V	Green
12	GNSS PPS	3.3/5 V	Purple
13 to 14	—	—	—
15	Index	0 to 3.3 V	Gray
16	Encoder	0 to 3.3 V	Gray/White

Wire colors: applicable to extension cables and connection box cables.

- Before connecting or disconnecting an external GNSS signal (either using the cable's GNSS wire or via the connection box's GNSS port), make sure the lidar is powered off.
- If the lidar has to stay powered on, make sure to ground yourself in advance. Do NOT touch the GNSS wire or GNSS port with bare hands.

Timing requirements of GNSS signals (PPS and NMEA)

Cycle of the PPS signal	$t_3 = 1 \text{ s} \pm 50 \mu\text{s}$ (rising edge to rising edge)
Pulse width of the PPS signal	$t_1 \geq 1 \text{ ms}$ Recommended range: 10 to 100 ms
Timing relationship	As indicated by the gray arrows, the NMEA signal: • Should start after the PPS rising edge of the current second. • Should end after the PPS falling edge of the current second. • Should end before the PPS rising edge of the next second; $t_2 \geq 100 \text{ ms}$.

2.2.2. Connector use

Connection	1. Turn off the power source. 2. Align the red dots on the connector shells. 3. Push the plug straight into the socket.
Disconnection	1. Turn off the power source. 2. Pull the release sleeve on the male connector to its outermost position and hold it. 3. Pull the plug from the socket.

Figure 11. Connection/Disconnection

- Before connection, check the pins on the socket and the holes on the plug. In case of bent pins or damaged holes, stop using the connector and contact technical support.
- To prevent breakdowns, turn off the power source before connection and disconnection.
- Do NOT attempt to force open a connection by pulling on the cables or by twisting the connectors in any way. Doing so can loosen the connectors' shells, or even damage the contacts.
- If the connector's shell is accidentally pulled off, stop using the connector and contact Hesai technical support. Do NOT attempt to assemble the connector's shell and cable collet; do NOT connect a connector without its shell. Doing so may damage the lidar's circuits.
- For further troubleshooting, please contact Hesai technical support or obtain work instructions from the connector manufacturer.

- The connector is designed to withstand at least 1000 mating cycles; exceeding this number may increase the risk of connector damage.

2.2.3. Cables (Ethernet)

Outer diameter (OD) = 7.70 ± 0.30 mm

Minimum bend radius = $5 \times OD$

2.3. Connection box (optional)

Users may connect the lidar with or without a connection box.

Figure 12. Connection box

- Unit: mm
- Lemo part number: FSG.2T.316.CLAC80Z (male plug, on the connection box)

2.3.1. Ports

Figure 13. Connection box (front)

Port number	Port name	Description	
a	Standard Ethernet port	RJ45, Standard 1000BASE-T Ethernet	
b	Power port	Use a DC-005 power socket (outer diameter: 5.5 mm; inner diameter: 2.1 mm).	
c	GNSS port	Accepts GNSS signals (for time synchronization).	
		Connector	JST: SM06B-SRSS-TB
		Recommended connector for the external GNSS module	JST: SHR-06V-S-B
		Voltage standard	RS232
		Baud rate	9600 bps

GNSS port pins (left to right):

Pin number	Direction	Description	Requirements
1	Input	PPS signal for synchronization	TTL level 3.3/5 V Recommended pulse width: ≥ 1 ms Signal cycle: 1 s (rising edge to rising edge)

Pin number	Direction	Description	Requirements
2	Output	Power for the external GNSS module	5 V
3	Output	Ground for the external GNSS module	-
4	Input	Receiving serial data from the external GNSS module	RS232 level
5	Output	Ground for the external GNSS module	-
6	-	Reserved	-

Figure 14. Connection box (back)

Port number	Port name	Description
d	Trigger port	Outputs external trigger signals for multi-sensor synchronization.
		Connector (male plug) Molex, LLC: 5023520300
		Recommended wire connector (female socket) Molex, LLC: 5023510300
		Voltage 0 to 3.3 V
		Signal type Pulse
		Max. output current 3 mA

Trigger port pins (left to right):

Pin No.	Direction	Signal	Description
1	Input	GND	Ground signal.
2	Output	Trigger-Encoder	Outputs one pulse when the lidar rotates 0.05° Pulse width: 8.31 μ s @ 600 RPM, 4.17 μ s @ 1200 RPM
3	Output	Trigger-Index	Outputs one pulse when Channel 42 passes the lidar's 180° position (see Figure 3. Lidar azimuthal position (top view)). Pulse width: 2.87 μ s @ 600 RPM, 1.44 μ s @ 1200 RPM

2.3.2. Connection

Figure 15. Connection when using GNSS

Figure 16. Connection when using PTP

2.4. Network settings on the host computer

The lidar has no power switch. It starts transmitting data when both of these conditions are met:

- The lidar is connected to power.
- The lidar is connected to a host computer via Ethernet.

To analyze point cloud data, configure the network parameters of the host computer:

Network parameters	Value	Description
IP address	192.168.1.X	X can be selected from 2 to 200 and from 202 to 254.
Subnet mask	255.255.255.0	-
VLAN ID	Range: 1 to 4094	Required only when VLAN tagging is used. Make sure the host computer and the lidar use the same VLAN ID.

2.4.1. In Windows

1. [**Control Panel**] > [**Network and Internet**] > [**Network and Sharing Center**] > [**Change adapter settings**].
2. Right-click [**Ethernet**] or [**Ethernet X**] which shows Ethernet connection (with no red cross at the bottom left of the icon) > Select [**Properties**].

3. Double-click [**Internet Protocol Version 4 (TCP/IPv4)**].
4. Select [**Use the following IP addresses**] > Input the host computers's IP address and subnet mask.

Ping command can be used to check the connection:

1. Press Win + R to open the Run dialog box.
2. Enter "cmd" and click [**OK**] to open the Command Prompt.
3. Enter "ping 192.168.1.201" and check the output.

5. To enable VLAN tagging:

Click [**Configure**] > Under the [**Advanced**] tag, select [**VLAN ID**] from the [**Property**] list > Input a VLAN ID in the [**Value**] box > Click [**OK**].

If the [**Property**] list has no [**VLAN ID**], it is recommended to update the network adapter driver.

2.4.2. In Ubuntu

1. Find the host computer's network interface name.

Method 1

- a. Open **Settings — Network**.
- b. Look for the interface whose status is "Connected".
The name in parentheses after "Ethernet" is the network interface name.

Method 2

- a. Open a terminal and run this command:

```
ifconfig
```

- b. Look for the interface with non-zero RX packets and bytes.
(In the example below, **enp5s0** shows non-zero Rx packets and bytes, indicating active data transmission.)

```
> ifconfig
docker0: flags=4099<UP,BROADCAST,MULTICAST> mtu 1500
    inet [REDACTED] netmask [REDACTED] broadcast [REDACTED]
    ether [REDACTED] txqueuelen 0 (Ethernet)
    RX packets 0 bytes 0 (0.0 B)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 0 bytes 0 (0.0 B)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

enp2s0f0: flags=4099<UP,BROADCAST,MULTICAST> mtu 1500
    ether [REDACTED] txqueuelen 1000 (Ethernet)
    RX packets 0 bytes 0 (0.0 B)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 0 bytes 0 (0.0 B)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

enp5s0: flags=4099<UP,BROADCAST,MULTICAST> mtu 1500
    ether [REDACTED] txqueuelen 1000 (Ethernet)
    RX packets 267706980 bytes 300970909734 (300.9 GB)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 3184 bytes 590575 (590.5 KB)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0
```

When not using VLAN

2. Run this command in the terminal:

```
sudo ifconfig ${interface_name} ${ip_addr}
```

- Replace `${interface_name}` with the host computer's network interface name.
- Replace `${ip_addr}` with the host computer's IP address.

When using VLAN

2. Run this command in the terminal:

```
sudo ip link add link ${interface_name} name ${interface_name}.${vlan_id} type vlan id ${vlan_id}
sudo ip link set up ${interface_name}.${vlan_id}
sudo ip addr add ${ip_addr}/24 dev ${interface_name}.${vlan_id}
ip addr show ${interface_name}.${vlan_id}
```

- Replace `${interface_name}` with the host computer's network interface name.
- Replace `${vlan_id}` with the host computer's VLAN ID.
- Replace `${ip_addr}` with the host computer's IP address.

2.5. Tools

Tool	Purpose	Where to find it
PandarView 2	Point cloud visualization software: To record and display point cloud data.	Download it at: https://www.hesaitech.com/downloads/
Web Control	To set parameters, check device info and status, or upgrade firmware and software.	See Section 4 Web Control .
HTTP API	To set parameters, check device info and status, or upgrade firmware and software.	Contact Hesai technical support to receive the API Reference Manuals.
Pandar TCP Commands (PTC) API	To set parameters, check device info and status, or upgrade firmware and software.  Network parameters: • Default Source IPv4 address: 192.168.1.201 • Default PTC port: 9347	Contact Hesai technical support to receive the API Reference Manuals.
Software development kits (SDKs) and ROS drivers	To assist development.	Visit Hesai's official GitHub page: https://github.com/HesaiTechnology

3. Data structure

Unless otherwise specified, all the multi-byte fields are unsigned values in little-endian format.

1. When point cloud signature is disabled, the **Cyber security** part (32 bytes) will be omitted.

2. Network monitoring software (such as WireShark) usually does not display the **Ethernet tail** (4 bytes).

Figure 17. Data structure

3.1. Point Cloud Data Packet

Before receiving Point Cloud Data Packets, please perform [Network settings on the host computer](#).

3.1.1. Ethernet Header

Point Cloud Data Packet: Ethernet Header

Field	Byte(s)	Description
Ethernet II MAC	12	Destination MAC: xx:xx:xx:xx:xx:xx (FF:FF:FF:FF:FF:FF for broadcast) Source MAC: xx:xx:xx:xx:xx:xx
Ethernet Data Packet Type	2	0x08, 0x00
Internet Protocol	20	Protocol parameters
UDP Port Number	4	Source port (default: 10000) Destination port (default: 2368)
UDP Length	2	Eight bytes more than point cloud UDP data (see Figure 17. Data structure).
UDP Checksum	2	Checksum of the Ethernet Header

3.1.2. Point cloud UDP data

Pre-Header

Field	Byte(s)	Description
Start of Packet	1	0xEE
Start of Packet	1	0xFF
Protocol Version Major	1	Main class of the point cloud UDP packet structure Current value: 0x01
Protocol Version Minor	1	Subclass of the point cloud UDP packet structure Current value: 0x04
Reserved	2	-

Header

Field	Byte(s)	Description												
Channel Num	1	Number of laser channels Always 0x80 (128)												
Block Num	1	Number of block(s) per packet Always 0x02 (2)												
First Block Return	1	Reserved												
Dis Unit	1	Always 0x04 (4 mm)												
Return Num	1	Maximum number of returns from each channel 0x02 (2)												
Flags	1	Each bit indicates whether this data packet contains certain information. 1 — YES 0 — NO												
		<table><tr><th>Bit</th><th>Value</th></tr><tr><td>[7:4] Reserved</td><td>-</td></tr><tr><td>[3] Digital Signature</td><td>1</td></tr><tr><td>[2] Functional Safety</td><td>1</td></tr><tr><td>[1] IMU</td><td>1</td></tr><tr><td>[0] UDP Sequence</td><td>1</td></tr></table>	Bit	Value	[7:4] Reserved	-	[3] Digital Signature	1	[2] Functional Safety	1	[1] IMU	1	[0] UDP Sequence	1
		Bit	Value											
		[7:4] Reserved	-											
		[3] Digital Signature	1											
		[2] Functional Safety	1											
		[1] IMU	1											
[0] UDP Sequence	1													

Body

Field	Byte(s)	Description
Azimuth 1	2	For Block 1: Current reference angle of the azimuth. Unit: 0.01°
Block 1	384	For Block 1: Measurements made by each channel (starting from Channel 1) Refer to Each block in the body .
Azimuth 2	2	For Block 2: Current reference angle of the azimuth
Block 2	384	For Block 2: Measurements made by each channel (starting from Channel 1)
CRC 1	4	CRC-32/MPEG-2 checksum of the Body

Return mode

The available return mode(s) are listed in the **Return Mode** field in [Section 3.1.2.5 Tail](#).

In Single Return mode, the measurements of each round of firing are stored in one block.

In Dual Return mode, the measurements of each round of firing are stored in two adjacent blocks (see table below), and the **Azimuth** fields of these two blocks are the same.

Return mode	Block 1	Block 2	Note
Last and Strongest	Last return	Strongest return	If the last return is also the strongest, then Block 2 stores the second strongest return.
Last and First	Last return	First return	If there is only one return, then Block 1 and Block 2 store the same data.
First and Strongest	First return	Strongest return	If the first return is also the strongest, then Block 2 stores the second strongest return.

Each block in the body: $3 \times 128 = 384$ bytes

Field	Byte(s)	Description
Channel 1: Distance	2	See Definition of the Distance field .
Channel 1: Reflectivity	1	Range: 0 to 255 Default: linear mapping (Reflectivity = Reflectivity × 1%) Also refer to Appendix C Nonlinear reflectivity mapping.  The mapping between this field and target reflectivity can be selected using Web Control or PTC commands.
Channel 2: Distance	2	See above.
Channel 2: Reflectivity	1	See above.
...	...	...
Channel 128: Distance	2	See above.
Channel 128: Reflectivity	1	See above.

Definition of the Distance field (when Up-Close Blockage Detection is OFF)

Distance	Description
≥ 75	Object distance = Distance × Dis Unit ≥ 0.3 m Dis Unit: See Section 3.1.2.2 Header
= 0	No valid data point.

Definition of the Distance field (when Up-Close Blockage Detection is ON)

Distance	Description
≥ 75	Object distance = Distance $\times$ Dis Unit ≥ 0.3 m Dis Unit : See Section 3.1.2.2 Header
= 0	No laser emission.
= 1	Return signal is received but the distance measurement is less than 0.3 m (lower limit of the lidar measurement range). Therefore, no valid data point.
= 2	Return signal is received and the distance measurement falls within 0.3 m and 2.85 m (near-field measurement range), but the current channel is not a near-field-enabled channel (see Appendix A Channel distribution data). Therefore, no valid data point.
= 3	Either no return signal is received, or the return signal is rejected. Thus no valid data point.  Common reasons for return signal rejection: • The signal is generated by another lidar unit. • Object distance exceeds the upper limit of the lidar's measurement range. • Pulse intensity is below the threshold. • When Retro Multi-Reflection Filtering (see Section 4.2.2 Function) is ON, the current data point is filtered out.

Users may enable or disable Up-Close Blockage Detection (see [Section 4.2.2 Function](#)).

Functional Safety

- The Functional Safety part of a Point Cloud Data Packet updates only every 5 ms. Therefore, adjacent packets may contain identical Functional Safety data.
- The Lidar States and fault codes are described in the Safety Manual. Please contact Hesai technical support for more information.

Field	Byte(s)	Description
FS Version	1	Version number of the functional safety module (currently 0x00)
Lidar State	1	[7:5] is the current Lidar State. d-0 (b-000) Initialization d-1 (b-001) Normal d-2 (b-010) Warning d-3 (b-011) Pre-Performance Degradation d-4 (b-100) Performance Degradation d-5 (b-101) Pre-Shutdown d-6 (b-110) Shutdown or Output Untrusted d-7 (b-111) Standby
Fault Code Type		[4:3] is the type of fault code in this data packet. b-00 No fault b-01 Current fault b-10 Past fault (not yet supported)
Rolling Counter		[2:0] indicates whether the fault reporting system gets stuck. Starting from 0, the rolling counter increments by 1 every 5 ms. Range: d-0 (b-000) to d-5 (b-101)
Total Fault Code Num	1	[7:4] is the total number of fault codes in the buffer queue.
Fault Code ID		[3:0] is the sequence number of the current fault code in the buffer queue, starting from 1.

Field	Byte(s)	Description
Fault Code	2	The fault code sent by this data packet
Reserved	8	-
CRC 2	4	CRC-32/MPEG-2 checksum of Functional Safety part (from the Lidar State field to the Reserved field).

Tail

Field	Byte(s)	Description
Reserved	9	-
Azimuth State	2	[15:14] is the azimuth state of Block 1, and [13:12] the azimuth state of Block 2. - Used for looking up the laser firing time; see Section B.4 Laser firing time of each channel - Range: 0 to 3 (High Resolution mode), 0 to 1 (Standard or Energy Saving mode) [11:0] is reserved.
Operational State	1	0 — High Resolution 1 — Shutdown 2 — Standard 3 — Energy Saving (reduced ranging capability)
Return Mode	1	0x33 — First 0x37 — Strongest 0x38 — Last 0x39 — Last and Strongest (default) 0x3B — Last and First 0x3C — First and Strongest

Field	Byte(s)	Description														
Motor Speed	2	Unit: RPM  Spin rate of the motor (RPM) = frame rate (Hz) × 60														
Date & Time	6	Whole second part of the Coordinated Universal Time (UTC) of this data packet <table><tr><th>Each byte</th><th>Range (decimal)</th></tr><tr><td>Year (current year minus 1900)</td><td>≥70</td></tr><tr><td>Month</td><td>1 to 12</td></tr><tr><td>Day</td><td>1 to 31</td></tr><tr><td>Hour</td><td>0 to 23</td></tr><tr><td>Minute</td><td>0 to 59</td></tr><tr><td>Second</td><td>0 to 59</td></tr></table>  The absolute time of a Point Cloud Data Packet is defined in Appendix B Absolute time of point cloud data.	Each byte	Range (decimal)	Year (current year minus 1900)	≥70	Month	1 to 12	Day	1 to 31	Hour	0 to 23	Minute	0 to 59	Second	0 to 59
Each byte	Range (decimal)															
Year (current year minus 1900)	≥70															
Month	1 to 12															
Day	1 to 31															
Hour	0 to 23															
Minute	0 to 59															
Second	0 to 59															
Timestamp	4	The microsecond part of the Coordinated Universal Time (UTC) of this data packet. Unit: μs Range: 0 to 999 999 μs  The absolute time of a Point Cloud Data Packet is defined in Appendix B Absolute time of point cloud data.														
Factory Information	1	Fixed: 0x42														
UDP Sequence	4	Sequence number of this data packet Range: 0 to 0xFF FF FF FF														

Field	Byte(s)	Description								
IMU Temperature	2	Temperature provided by the inertial measurement unit (IMU) Data type: signed integer Unit: 0.01°C								
IMU Acceleration Unit	2	Conversion factor of acceleration Data type: unsigned integer Current value: 244 (0x00F4) Unit of acceleration: $0.001\text{ mg} \times 244 = 0.244\text{ mg}$ (g : standard gravity)								
IMU Angular Velocity Unit	2	Conversion factor of angular velocity Data type: unsigned integer Current value: 1750 (0x06D6) Unit of angular velocity: $0.01\text{ mdps} \times 1750 = 17.5\text{ mdps}$ (millidegree per second)								
IMU Timestamp	4	Timestamp of the IMU data Counting from 0 after powering on the lidar or after an overflow. Unit: 25 μs Range: 0 to approx. 29.83 hours								
IMU X Axis Acceleration	2	Acceleration of the X-axis, measured by the IMU Data type: signed integer <table><tr><td>Data type</td><td>Signed integer</td></tr><tr><td>Measurement range</td><td>$\pm 8\text{ g}$</td></tr><tr><td>Unit of acceleration</td><td>See the IMU Acceleration Unit field; currently 0.244 mg.</td></tr><tr><td>Example</td><td>When this field is 5, X-axis acceleration = $5 \times 0.244\text{ mg} = 1.22\text{ mg}$.</td></tr></table>	Data type	Signed integer	Measurement range	$\pm 8\text{ g}$	Unit of acceleration	See the IMU Acceleration Unit field; currently 0.244 mg .	Example	When this field is 5, X-axis acceleration = $5 \times 0.244\text{ mg} = 1.22\text{ mg}$.
Data type	Signed integer									
Measurement range	$\pm 8\text{ g}$									
Unit of acceleration	See the IMU Acceleration Unit field; currently 0.244 mg .									
Example	When this field is 5, X-axis acceleration = $5 \times 0.244\text{ mg} = 1.22\text{ mg}$.									
IMU Y Axis Acceleration	2	Acceleration of the Y-axis								
IMU Z Axis Acceleration	2	Acceleration of the Z-axis								

Field	Byte(s)	Description
IMU X Axis Angular Velocity	2	Angular velocity of the X-axis, measured by the IMU.
		Data type Signed integer
		Measurement range ± 500 dps
		Unit of angular velocity See the IMU Angular Velocity Unit field; currently 17.5 mdps.
		Example When this field is 5, X-axis angular velocity = 5×17.5 mdps = 87.5 mdps.
IMU Y Axis Angular Velocity	2	Angular velocity of the Y-axis
IMU Z Axis Angular Velocity	2	Angular velocity of the Z-axis
CRC 3	4	CRC-32/MPEG-2 checksum of the Tail

Cyber Security (optional)

Field	Byte(s)	Description
Signature	32	Point cloud signature Calculated using Point Cloud UDP Data (from Pre-Header to Tail, appended with UDP Sequence) Algorithm: HMAC-SHA256

This field is added after specifying a Shared Secret Key and starting a session; see [Section 4.9.3 Point cloud signature](#).

3.1.3. Ethernet tail

Field	Byte(s)	Description
FCS	4	Frame check sequence

3.1.4. Point cloud data analysis method

Take **Channel 5** in **Block 2** as an example.

Analyze the vertical angle of a data point

The designed vertical angle of Channel 5 is 12.165°, according to [Appendix A Channel distribution data](#).

- The accurate vertical angles are recorded in the angle correction file of this lidar; see [Section 1.4 Channel distribution](#).
- 0° is the horizontal direction.
- The upward direction is defined as positive; see [Figure 4. Channel vertical distribution](#).

Analyze the horizontal angle of a data point

The Y-axis of the lidar coordinate system is 0°. The clockwise direction (in the top view) is defined as positive; see [Figure 3. Lidar azimuthal position \(top view\)](#).

$$\text{Horizontal angle} = \textcircled{1} + \textcircled{2}$$

- ① Angular position at the start time (see [Section B.3 Start time of each block](#)) of the current block
- ② Firing time angular offset of the current firing channel

$$\textcircled{1} = \textcircled{3} + \textcircled{4}$$

- ③ Current reference azimuth of this block
Can be read from the **Azimuth** field of **Block 2**. See [Section 3.1.2.3 Body](#).
- ④ Horizontal angle offset of the current firing channel
The offset of **Channel 5** is 1.093°, according to [Appendix A Channel distribution data](#).

The accurate horizontal angle offsets are recorded in the angle correction file of this lidar; see [Section 1.4 Channel distribution](#).

$$\textcircled{2} = \textcircled{5} \times \textcircled{6}$$

- ⑤ Firing time offset of the current firing channel
See [Section B.4 Laser firing time of each channel](#).
- ⑥ Spin rate of the motor
See the **Motor Speed** field in [Section 3.1.2.5 Tail](#). The unit should be converted to °/s.

Analyze the distance of a data point

See the **Distance** field of **Block 2: Channel 5** in [Section 3.1.2.3 Body](#).

Draw the data point in a spherical or rectangular coordinate system

Obtain the real-time point cloud data by analyzing and drawing every data point in each frame

3.2. GNSS Data Packet

- Please configure network parameters on the host computer before receiving GNSS Data Packet. See [Section 2.4 Network settings on the host computer](#).
- When GNSS is selected as the clock source, a GNSS Data Packet is triggered every second; When PTP is selected as the clock source, the lidar does not output GNSS Data Packet.

To select the clock source, refer to [Section 4.2.3 Time sync](#).

All the multi-byte values are unsigned and in little-endian format.

3.2.1. Ethernet Header

GNSS Data packet: Ethernet Header

Field	Byte(s)	Description
Ethernet II MAC	12	Destination MAC: xx:xx:xx:xx:xx:xx (FF:FF:FF:FF:FF:FF for broadcast) Source MAC: xx:xx:xx:xx:xx:xx
Ethernet Data Packet Type	2	0x08, 0x00
Internet Protocol	20	Protocol parameters
UDP Port Number	4	Source port (default: 10000) Destination port (default: 10110)
UDP Length	2	8 bytes more than GNSS UDP data; see Figure 17. Data structure
UDP Checksum	2	Checksum of the Ethernet Header

3.2.2. GNSS UDP data

Field	Byte(s)	Description															
GNSS Time Data	18	GNSS time, accurate to the second															
		<table><tr><th>Field</th><th>Bytes</th><th>Description</th></tr><tr><td>GNSS Header</td><td>2</td><td>0xFFEE (0xFF first)</td></tr><tr><td>Date</td><td>6</td><td>Year, month, and day in ASCII (2 bytes each, lower byte first)</td></tr><tr><td>Time</td><td>6</td><td>Second, minute, and hour in ASCII (2 bytes each, lower byte first)</td></tr><tr><td>Reserved</td><td>4</td><td>-</td></tr></table>	Field	Bytes	Description	GNSS Header	2	0xFFEE (0xFF first)	Date	6	Year, month, and day in ASCII (2 bytes each, lower byte first)	Time	6	Second, minute, and hour in ASCII (2 bytes each, lower byte first)	Reserved	4	-
		Field	Bytes	Description													
		GNSS Header	2	0xFFEE (0xFF first)													
		Date	6	Year, month, and day in ASCII (2 bytes each, lower byte first)													
		Time	6	Second, minute, and hour in ASCII (2 bytes each, lower byte first)													
Reserved	4	-															
NMEA Data	84	 Users can select the NMEA sentence to be received (see GNSS Mode in Section 4.2.3 Time sync).															
Reserved	404	404 bytes of 0xDF															
GNSS Positioning Status	1	ASCII code, obtained from the NMEA sentence															
PPS Lock Flag	1	1 — Locked 0 — Unlocked															
Reserved	4	-															

GPRMC data format

```
$GPRMC, <01>, <02>, <03>, <04>, <05>, <06>, <07>, <08>, <09>, <10>, <11>, <12>*hh
```

Field No.	Field	Description
<01>	UTC Time	Hour, minute, and second Typically in hhmmss (hour, minute, second) format
<02>	Location Status	A (hex = 41) — Active (valid position) V (hex = 56) — Void (invalid position) NUL (hex = 0) — GPS unlocked
...	...	...
<09>	UTC Date	Date information Typically in ddmmyy (day, month, year) format
...	...	...

The lidar's GPS data interface accepts a variety of GPRMC formats, as long as:

Field <01> (after the first comma separator) is the hour, minute, and second information.
Field <09> (after the ninth comma separator) is the date information.

For example, the following formats are both acceptable:

```
$GPRMC,072242,A,3027.3680,N,11423.6975,E,000.0,316.7,160617,004.1,W*67
$GPRMC,065829.00,A,3121.86377,N,12114.68322,E,0.027,,#160617#,, ,A*74
```

GPGGA data format

```
$GPGGA, <01>, <02>, <03>, <04>, <05>, <06>, <07>, <08>, <09>, <10>, <11>, <12>*hh
```

Field No.	Field	Description																
<01>	UTC Time	Hour, minute, and second Typically in hhmmss (hour, minute, second) format																
...	...	...																
<06>	GPS Fix Quality	Range: 0 to 9 Refer to the description given by the GPS device provider. Common definitions: <table><tr><td>0</td><td>Invalid</td><td>4</td><td>RTK fix</td></tr><tr><td>1</td><td>GPS fix (SPS)</td><td>5</td><td>RTK float</td></tr><tr><td>2</td><td>DGPS fix</td><td>6</td><td>Estimated (dead reckoning)</td></tr><tr><td>3</td><td>PPS fix</td><td>-</td><td>-</td></tr></table>	0	Invalid	4	RTK fix	1	GPS fix (SPS)	5	RTK float	2	DGPS fix	6	Estimated (dead reckoning)	3	PPS fix	-	-
0	Invalid	4	RTK fix															
1	GPS fix (SPS)	5	RTK float															
2	DGPS fix	6	Estimated (dead reckoning)															
3	PPS fix	-	-															
...	...	...																

The lidar's GPS data interface accepts a variety of GPGGA formats, as long as:

Field <01> (after the first comma separator) is the hour, minute, and second information.

For example, the following formats are both acceptable:

```
$GPGGA,123519,4807.038,N,01131.000,E,1,08,0.9,545.4,M,46.9,M,,*47
$GPGGA,134658.00,5106.9792,N,11402.3003,W,2,09,1.0,1048.47,M,-6.27,M,08,AAAA*60
```

3.2.3. Ethernet tail

Field	Byte(s)	Description
FCS	4	Frame check sequence

3.2.4. GNSS time data analysis method

> Data (512 bytes)

Figure 18. GNSS Data packet: GNSS time data (example)

Date

Field	Data (in ASCII)	Characters	Meaning
Year	0x30 0x32	'0', '2'	20
Month	0x34 0x30	'4', '0'	04
Day	0x37 0x30	'7', '0'	07

Time

Field	Data (in ASCII)	Characters	Meaning
Second	0x38 0x35	'8', '5'	58
Minute	0x37 0x30	'7', '0'	07
Hour	0x34 0x30	'4', '0'	04

4. Web Control

Web Control is used for setting parameters, viewing device info, and upgrading software/firmware.

To access Web Control, follow the steps below:

1. Connect the lidar to your PC using an Ethernet cable.
2. Complete [Section 2.4 Network settings on the host computer](#).
3. Enter 192.168.1.201 in your web browser.

- Google Chrome and Mozilla Firefox are recommended.
- Firewall port exceptions: Port 9347 (PTC/PTCS), Port 80 (HTTP), Port 443 (HTTPS), and Ports 319 and 320 (PTP 1588v2)

4.1. Home

Status	
Spin Rate	600 RPM
GPS	Unlock
NMEA (GPRMC/GPGGA)	Unlock
PTP	Free Run
Device Info	Device Log
Model	Pandar128E3X
S/N	P128XXXXXXXXXXXXXX
MAC Address	XX:XX:XX:XX:XX:XX
P/N	Pandar128E3X-A01
Software Version	1.45.127
Sensor Firmware Version	1.45.141
Controller Firmware Version	1.45.130

The above Part Number and version numbers may be different from the actual ones. Please refer to the web page of the lidar.

Buttons and parameters

Device Log	Click to download a JSON file that contains the lidar status, device info, all configurable parameters, and the upgrade log.
Spin Rate	Spin Rate of the motor (RPM) = frame rate (Hz) $\times$ 60
GPS	GNSS pulse-per-second (PPS) status • Lock: Lidar's internal clock is in sync with GNSS PPS. • Unlock: Not in sync.
NMEA (GPRMC/GPGGA)	NMEA status • Lock: After receiving a valid NMEA message. • Unlock: Not receiving a valid NMEA message for over 2 seconds.
PTP	PTP status • Free Run: No PTP master is selected. • Tracking: Attempting to sync with the selected PTP master, but the absolute offset exceeds the user-specified limit in Section 4.2.3 Time sync. • Locked: The absolute offset is within the user-specified limit. • Frozen: The lidar has lost connection to the PTP master and is attempting to recover it. Meanwhile, lidar time will drift from the last synchronized time. When the time drift exceeds the specification, PTP status will change to Free Run.
P/N	Part Number • Cannot be changed. • Format: [Model]-[Configuration] • Lidar units with earlier firmware versions can be upgraded to display P/N. The default P/N is the Product Model (Pandar128E3X).

Customer P/N

Customer-specified Part Number

- Default: Empty and not displayed.
- Format: 1 to 20 characters, digits or hyphen (-).

- Users may send PTC or HTTP commands (see [Section 2.5 Tools](#)) to:
 - enable/disable the display of Customer P/N;
 - change Customer P/N.
- Settings to the Customer P/N:
 - are not changed by firmware upgrades/downgrades;
 - are not affected by the [**Reset All Settings**] button (on the Settings page).

4.2. Settings

		Reset All Settings
Control IP		
IPv4 Address		192.168.1.201
IPv4 Mask		255.255.255.0
IPv4 Gateway		192.168.1.1
VLAN	☐	0
Ethernet Communication Mode		Slave
Settings		
Destination IP		255.255.255.255
Lidar Destination Port		2368
Spin Rate		600 RPM
Return Mode		Last and Strongest
Sync Angle	☐	0
Trigger Method		Angle Based
Clock Source		GPS
GPS Mode		GPRMC
GPS Destination Port		10110
Noise Filtering		OFF
Interstitial Points Filtering		OFF
Retro Multi-Reflection Filtering		OFF

Up-Close Blockage Detection	OFF
Reflectivity Mapping	Linear Mapping
Rotation Direction	Clockwise
Operational Mode	Dynamic/Constant
Standby Mode	In Operation/Standby
Save	

Buttons

- Reset All Settings** Reset all the configurable parameters to factory defaults, including:
- [Settings](#)
 - [Azimuth FOV](#)
 - [High Resolution](#)
- Save** Save and execute all the settings on this page.
Exception: Standby Mode takes effect immediately without having to click this button.

4.2.1. Network

Parameter	Options	Description
VLAN	Default: OFF VLAN ID: 1 to 4094	To enable VLAN tagging: • make sure the host computer also supports VLAN; • check the checkbox and input the lidar's VLAN ID (same as the host computer's VLAN ID).  If the lidar's VLAN ID differs from the host computer's, users will lose access to Web Control. To minimize such risks, the VLAN ID is zero (an invalid value) by default. • When checking the checkbox, users will be alerted to input a valid VLAN ID. • When unchecking the checkbox, the VLAN ID will default to zero.  • Once configured, the VLAN ID will not change during firmware upgrades. • When VLAN is enabled, PTP connection will be lost; when VLAN is disabled, PTP connection will automatically recover.

Parameter	Options	Description								
Ethernet Communication Mode	Slave (default) Master	Only for automotive Ethernet (1000BASE-T1). Slave mode (default): • The host computer shall be in Master mode. • Connect the lidar with or without a connection box. Master mode: • Connect the lidar to a Master host, select "Master" and click the [Save] button at the bottom of the Settings page. • Connection to Web Control will be lost. Then connect the lidar to a Slave host. • Connection box is not supported.  If the lidar's Ethernet communication mode is the same as the host computer's, users will lose access to Web Control. To minimize such risks, please take special care when changing this setting.								
Destination IP	Any except 0.0.0.0, 127.0.0.1, and the lidar's IPv4 address Default: 255.255.255.255	<table><tr><th>Communication mode</th><th>Destination IP</th></tr><tr><td>Broadcast (default)</td><td>255.255.255.255</td></tr><tr><td>Multicast</td><td>User-defined</td></tr><tr><td>Unicast</td><td>Same as the PC's IPv4 address</td></tr></table>	Communication mode	Destination IP	Broadcast (default)	255.255.255.255	Multicast	User-defined	Unicast	Same as the PC's IPv4 address
Communication mode	Destination IP									
Broadcast (default)	255.255.255.255									
Multicast	User-defined									
Unicast	Same as the PC's IPv4 address									
Lidar Destination Port	Default: 2368	Destination port of point cloud data and Web Control (HTTP API)								

4.2.2. Function

Parameter	Options	Description
Spin Rate	600 RPM (default) 1200 RPM	Spin rate of the motor The accurate spin rate is shown in Point Cloud Data Packets (see the Motor Speed field in Section 3.1.2.5 Tail). The set spin rate is also shown on the Home page (see Section 4.1 Home).
Return Mode	Single Return: • Last • Strongest • First Dual Return: • Last and Strongest (default) • Last and First • First and Strongest	Also shown in Point Cloud Data Packets (see the Return Mode field in Section 3.1.2.5 Tail).

Parameter	Options	Description				
Sync Angle	0 to 359 Unit: °	Phase lock angle • To activate this function, check the checkbox and input an azimuth. • At every full second, the lidar will rotate to that azimuthal position.  Lidar azimuthal position is defined in Section 1.3 Basic structure. Definition of the full second (detailed in Section B.1 Source of absolute time): • When GNSS is locked, the full second is defined as the rising edge of the GNSS PPS signal.  When PTP is tracking or locked, the full second is retrieved from the PTP signal. (PPS signal is not required nor used.) • When neither GNSS nor PTP is locked, the full second is defined as the rising edge of the lidar's internal 1 Hz signal. To phase-lock multiple lidar units, connect them to the same clock source and set the same sync angle. These lidar units will rotate to the same azimuthal position at every full second.				
Trigger Method	Angle-Based (default) Time-Based	The way laser firings are triggered <table><tr><td>Angle-based</td><td>Lasers fire every 0.1° at 10 Hz (or 0.2° at 20 Hz).</td></tr><tr><td>Time-based</td><td>Lasers fire every 27.78 μs.</td></tr></table>	Angle-based	Lasers fire every 0.1° at 10 Hz (or 0.2° at 20 Hz).	Time-based	Lasers fire every 27.78 μs.
Angle-based	Lasers fire every 0.1° at 10 Hz (or 0.2° at 20 Hz).					
Time-based	Lasers fire every 27.78 μs.					
Noise Filtering	OFF (default) ON	To reduce the scattered false positives (i.e. noise points) in point cloud data.				

Parameter	Options	Description				
Interstitial Points Filtering	OFF (default) ON	To reduce the interstitial points in point cloud data.  Definition of interstitial points: When a beam partially hits a front target's edge and further hits a rear target, the return signal can result in a false point located between both targets.				
Retro Multi-Reflection Filtering	OFF (default) ON	To reduce the false positives at twice the distance of a retroreflector.				
Up-Close Blockage Detection	OFF (default) ON	See Definition of the Distance field .				
Reflectivity Mapping	Linear mapping (default) Nonlinear mapping #1/#2	<table><tr><td>Linear mapping</td><td>The Reflectivity field in Point Cloud Data Packets linearly represents target reflectivity (0 to 255%).</td></tr><tr><td>Nonlinear mapping</td><td>The mapping between the Reflectivity field and target reflectivity is nonlinear. This increases the contrast in low-reflectivity areas (see Appendix C Nonlinear reflectivity mapping).</td></tr></table>	Linear mapping	The Reflectivity field in Point Cloud Data Packets linearly represents target reflectivity (0 to 255%).	Nonlinear mapping	The mapping between the Reflectivity field and target reflectivity is nonlinear. This increases the contrast in low-reflectivity areas (see Appendix C Nonlinear reflectivity mapping).
Linear mapping	The Reflectivity field in Point Cloud Data Packets linearly represents target reflectivity (0 to 255%).					
Nonlinear mapping	The mapping between the Reflectivity field and target reflectivity is nonlinear. This increases the contrast in low-reflectivity areas (see Appendix C Nonlinear reflectivity mapping).					
Rotation Direction	Clockwise (default) Counterclockwise	Direction of motor rotation				

Parameter	Options	Description															
Operational Mode	Dynamic (default) Constant	After selecting Operational Mode, the Operational States will shift automatically according to: • ambient temperature • Horizontal Resolution mode (see Section 4.4 High Resolution)															
		<table><tr><th>Operational mode</th><th>Horizontal Resolution mode</th><th>Operational States (in the order of priority)</th></tr><tr><td rowspan="2">Dynamic</td><td>Standard</td><td>Standard, Energy Saving, and Shutdown</td></tr><tr><td>High Resolution</td><td>High Resolution, Standard, Energy Saving, and Shutdown</td></tr><tr><td rowspan="2">Constant</td><td>Standard</td><td>Standard and Shutdown</td></tr><tr><td>High Resolution</td><td>High Resolution and Shutdown</td></tr></table>	Operational mode	Horizontal Resolution mode	Operational States (in the order of priority)	Dynamic	Standard	Standard, Energy Saving, and Shutdown	High Resolution	High Resolution, Standard, Energy Saving, and Shutdown	Constant	Standard	Standard and Shutdown	High Resolution	High Resolution and Shutdown		
		Operational mode	Horizontal Resolution mode	Operational States (in the order of priority)													
		Dynamic	Standard	Standard, Energy Saving, and Shutdown													
			High Resolution	High Resolution, Standard, Energy Saving, and Shutdown													
		Constant	Standard	Standard and Shutdown													
			High Resolution	High Resolution and Shutdown													
		Definition of Operational States:															
		<table><tr><th>Operational States</th><th>Horizontal Resolution mode</th><th>Laser power</th></tr><tr><td>High Resolution</td><td>High Resolution</td><td>Normal</td></tr><tr><td>Standard</td><td>Standard</td><td>Normal</td></tr><tr><td>Energy Saving</td><td>Standard</td><td>Half of normal value (reduced ranging capability)</td></tr><tr><td>Shutdown</td><td colspan="2">Motor not running and lasers not firing.</td></tr></table>	Operational States	Horizontal Resolution mode	Laser power	High Resolution	High Resolution	Normal	Standard	Standard	Normal	Energy Saving	Standard	Half of normal value (reduced ranging capability)	Shutdown	Motor not running and lasers not firing.	
		Operational States	Horizontal Resolution mode	Laser power													
		High Resolution	High Resolution	Normal													
		Standard	Standard	Normal													
Energy Saving	Standard	Half of normal value (reduced ranging capability)															
Shutdown	Motor not running and lasers not firing.																
Standby Mode	In Operation (default) Standby	In Standby mode, the motor stops running and lasers stop firing.															

4.2.3. Time sync

With GNSS selected

Clock Source	GPS
GPS Mode	GPRMC
GPS Destination Port	10110

With PTP selected

Clock Source	PTP
Profile	1588v2
Time Offset for Lidar Lock	1
PTP Network Transport	UDP/IP
PTP Domain Number	0
PTP logAnnounceInterval	1
PTP logSyncInterval	1
PTP logMinDelayReqInterval	0

Parameter	Options	Description
Clock Source	GPS (default) PTP	External source of absolute time

With GNSS selected

Parameter	Options	Description
GPS Mode	GPRMC (default) GPGGA	Format of the NMEA data received from the external GNSS module (see Section 3.2.2 GNSS UDP data)
Destination Port	Default: 10110	Port used for sending GNSS Data Packets

With PTP selected

The lidar does NOT output GNSSA Data Packets.

Parameter	Options	Description
Profile	1588v2 (default) 802.1AS 802.1AS Automotive	IEEE timing and synchronization standard
Time Offset for Lidar Lock	1 to 100 μ s (integer) Default: 1	Upper limit of the absolute offset between Slave and Master when the lidar is in PTP Locked status; see Section 4.1 Home .
PTP Network Transport	UDP/IP (default) L2	Network transport protocol
		UDP/IP Available only for the 1588v2 profile
		L2 Available for all profiles
Domain Number	0 to 127 (integer) Default: 0	Domain attribute of the local clock

When using the 1588v2 profile, these additional parameters can be configured:

Parameter	Options	Description
PTP logAnnounceInterval	-2 to 3	Time interval between Announce messages Default: 1 (2 seconds)
PTP logSyncInterval	-7 to 3	Time interval between Sync messages Default: 1 (2 seconds)
PTP logMinDelayReqInterval	-7 to 3	Minimum permitted mean time between Delay_Req messages Default: 0 (1 second)

When using the 802.1AS or 802.1AS Automotive profile:

Parameter	Options	Description
Switch Type	TSN (default) Non-TSN	Type of the network switch
		TSN
		Non-TSN

Time Sensitive Network, using Peer-to-Peer delay mechanism
Using End-to-End delay mechanism

4.3. Azimuth FOV

Azimuth FOV Setting	For all channels ▼
Save	

Buttons

Save Save and execute all the settings on this page.

Parameter	Options	Description
Azimuth FOV Setting	For all channels (default) Multi-section FOV	Configuration mode of the azimuth FOV The lidar outputs valid data only within the specified azimuth FOV ranges.

- The angles in degrees are accurate to the first decimal place.
- If the Start Angle is larger than the End Angle, then the actual range is the union of [Start Angle, 360°) and [0°, End Angle).
For instance, when the angle range is set to be [270°, 90°), the actual azimuth FOV is [270°, 360°) ∪ [0°, 90°).

4.3.1. For all channels

Input a start angle and an end angle to form a continuous angle range [Start, End].

This range applies to all channels.

Azimuth FOV Setting		For all channels
Azimuth FOV for All Channels	Start:	0.0
	End:	360.0
Save		

4.3.2. Multi-section FOV

Input multiple (≤ 5) sets of Start Angles and End Angles to form multiple continuous angle ranges.

These ranges apply to all channels.

Azimuth FOV Setting		Multi-section FOV
Multi-section FOV	Start Angle	End Angle
Azimuth FOV 1	0.0	0.0
Azimuth FOV 2	0.0	0.0
Azimuth FOV 3	0.0	0.0
Azimuth FOV 4	0.0	0.0
Azimuth FOV 5	0.0	0.0
Save		

4.4. High Resolution

Configure on-the-fly the horizontal resolution of far-field measurement.

Mode	High Resolution ▼
Save	

Buttons

Save Save and execute all the settings on this page.

Parameter	Options	Description		
Mode	Standard High Resolution (default)	Mode	Frame rate	Horizontal resolution of far-field measurement
		Standard	10 Hz	0.2° for all channels
			20 Hz	0.4° for all channels
		High Resolution	10 Hz	0.1° for the 64 high-res channels (Channel 26 to Channel 89) 0.2° for the other channels
			20 Hz	0.2° for the 64 high-res channels (Channel 26 to Channel 89) 0.4° for the other channels
		 Channel number counts from 1, top to bottom.		

- The horizontal resolution of near-field measurement is always 0.4° at 10 Hz (and 0.8° at 20 Hz).
- The definition of near/far-field measurement is in [Appendix A Channel distribution data](#).

4.5. Operation statistics

Start-Up Counts	510
Internal Temperature	32.10°C
Internal Humidity	50.0% RH
System Uptime	0 h 5 min
Total Operation Time	559 h 43 min
Internal Temperature	Operation Time
< -40°C	0 h 1 min
-40 to -20°C	0 h 46 min
-20 to 0°C	0 h 49 min
0 to 20°C	8 h 40 min
20 to 40°C	38 h 20 min
40 to 60°C	393 h 17 min
60 to 80°C	109 h 50 min
80 to 100°C	6 h 16 min
100 to 120°C	1 h 44 min
> 120°C	0 h 0 min

4.6. Monitor

These electrical parameters (measured at the lidar's external connector) are displayed in real time:

- Lidar Input Current
- Lidar Input Voltage
- Lidar Input Power

4.7. Upgrade

- Before upgrading, please contact Hesai technical support to obtain the .patch file.
- It is recommended to place a protective cover or other opaque material over the lidar's cover lens when upgrading.
- The instructions for downgrading are the same as those for upgrading.

Upgrade steps

1. Click the [**Upload**] button and select a .patch file to start the upgrade.
2. Wait for the process to be 100% complete. The lidar will automatically reboot.
3. The latest version numbers will display in "Upgrade" and "Home" pages.

If the upgrade fails, hard restart the lidar and try again.

Buttons

- Upload** To upload the .patch file
- Restart** Software reboot
Afterward, the Start-Up Counts in the Operation Statistics page increments by 1; see [Section 4.5 Operation statistics](#).

Parameter	Current version
Software version	1.45.127
Firmware of sensor version	1.45.141
Firmware of controller version	1.45.130
Upgrade log	-

The above version numbers may be different. The actual web page shall prevail.

4.8. Log

The process logs on this page are used for software troubleshooting.

Parameters

pandar_control	Lidar's control program
diag_ff	Functional safety diagnosis program
error	Exceptions that may affect the lidar's normal operation
warn	Exceptions that do not affect the lidar's normal operation

4.9. Security

Cyber security (Master Switch): OFF

Cyber Security (Master Switch)	OFF
Login Control	
Authentication	OFF
Secure Connection	
PTC Connection	Non-TLS
HTTP Connection	HTTP
Point Cloud Signature	
Share Secret Key ⓘ	
Save	

Cyber security (master switch): ON

Cyber Security (Master Switch)	ON
Login Control	
Authentication	ON
Current Password	_____ Forgot Password?
New Password	_____
Confirm New Password	_____
Secure Connection	
PTC Connection	TLS
HTTP Connection	HTTPS
Point Cloud Signature	
Share Secret Key ⓘ	
Save	

As shown in the previous page, the available settings depend on the Cyber Security Master Switch:

	Cyber Security (Master Switch): OFF (default)	Cyber Security (Master Switch): ON
Login control	OFF http:// 192.168.1.201 redirects to the Home page.	ON https:// 192.168.1.201 redirects to the Login page.
Secure connection	OFF PTC and HTTP (cleartext communication)	ON PTCS and HTTPS (encrypted communication; configuration required)
Point cloud signature	Setting the Shared Secret Key in cleartext poses data breach risks and is not recommended.	Users can change the shared secret key.

- Point cloud signature is deactivated by default. Its activation/deactivation is controlled by PTC commands (see [Section 2.5 Tools](#)), regardless of the Cyber Security Master Switch. This webpage only sets the Shared Secret Key of point cloud signature.
- Firmware and software upgrades are always encrypted and signed, regardless of the Cyber Security Master Switch.

4.9.1. Login control

When the Cyber Security Master Switch is ON:

Parameter	Options	Description
Authentication	Fixed: ON	Login control
Current password	-	When turning on/off the Cyber Security Master Switch or when changing the password, input here. • Default password: 123456 • To effectively implement login control, please change the default password and keep your new password securely. • Before returning a trial/loaner lidar or an RMA lidar to Hesai, please make sure to change the password back to default.
New password	-	Format • 8 to 30 characters • Containing at least one digit and one letter (case sensitive) • Special characters are allowed
Confirm new password	-	-

If you forget the password:

If TLS is selected for PTC Connection	Users should reset the password: 1. Click "Forgot password?" and it will redirect to the Reset Password page. 2. Obtain a reset code. 3. Contact technical support and provide the reset code to obtain a verification code. 4. Input the verification code in the Reset Password page and click the [Submit] button.
If mTLS is selected for PTC Connection	Users are allowed to change the password (without providing the current password) by sending a PTCS command (see Section 2.5 Tools).

4.9.2. Secure connection

When the Cyber Security Master Switch is ON:

TLS

Secure Connection	
PTC Connection	TLS
HTTP Connection	HTTPS

mTLS

Secure Connection	
PTC Connection	mTLS
Client CA Certificate	No file
Certificate Status	Invalid
Change Certificate	 Upload Remove
HTTP Connection	HTTPS

Parameter	Options	Description	
PTC connection	TLS (default) mTLS	PTC connection mode	
		TLS (one-way auth)	Only the user authenticates the lidar.
		mTLS (two-way authentication)	The user and the lidar authenticate each other. Recommended for enhanced security. - Click the [Upload] button to upload a user CA certificate chain. - Before returning a trial/loaner lidar or an RMA lidar to Hesai, click the [Remove] button to remove the uploaded certificate.

Parameter	Options	Description
HTTP Connection	Fixed: HTTPS	HTTP connection mode After configuring the HTTPS environment (see Section 4.9.4 Configure HTTPS environment): • The current URL switches from http://192.168.1.201 to https://192.168.1.201. • Communication becomes encrypted.

4.9.3. Point cloud signature

Parameter	Options	Description
Shared secret key	-	Used for negotiating a session key • Default key: 12345678 • To avoid data breach risks, please change the default key and keep your new key securely. Format: 8 to 32 digits or letters (case sensitive)

4.9.4. Configure HTTPS environment

Before using HTTPS, import the lidar CA certificate chain into your browser.

Without this step, HTTPS will not be activated, and a browser warning ("Not Secure") will appear when accessing Web Control.

Follow these steps to set up certificates in Chrome or Firefox (Windows 10).

1. Go to the "Settings".
2. Input "Certificates" in the search bar.
 - **Chrome:** Select [**Security**] > [**Manage device certificates**].
 - **Firefox:** Select [**View Certificates**].

Figure 19. In Chrome

Figure 20. In Firefox

3. Upload intermediate and root certificates

- **Chrome:**

- a. Click [**Intermediate Certificate Authorities**] tab > Click [**Import**] to upload the intermediate certificate.

- b. Click [**Trusted Root Certification Authorities**] tab > Click [**Import**] to upload the root certificate.

- **Firefox:**

Click [**Authorities**] tab > Click [**Import**] to upload the intermediate and root certificates, or upload the certificate chain file only.

Figure 21. In Chrome

Figure 22. In Firefox

4. If a "Security Warning" or "Downloading Certificate" dialog box appears:
- **Chrome:** Click [**Yes**].
 - **Firefox:** Select [**Trust this CA to identify websites**] > Click [**OK**].

Figure 23. In Chrome

Figure 24. In Firefox

5. The newly-added CAs will appear in the list. Double-click to view more detailed information.

Figure 25. In Chrome

Figure 26. In Firefox

4.10. Login

When the Cyber Security Master Switch on the [Security](#) page is ON, login control will be activated and the current URL will redirect to the Login page.

Parameter	Options	Description
Username	admin	-
Password	-	Default: 123456 To effectively implement login control, please change the default password (see Section 4.9.1 Login control) and keep your new password securely.

5. Maintenance

The lidar's cover lens is made of plastic (polycarbonate, PC), similar to the material used for car lamps.

- Do NOT wipe the cover lens when it is dry, nor use abrasive cleaners. Doing so can damage the optical coating.
- Do NOT use organic cleaners, which can damage the cover lens and even cause cracking.
 - Organic cleaners include but are not limited to tar removers, self-cleaning agents, adhesive removers, coating removers, foam cleaners, iron powder removers for car paint, glass cleaners, thinning agents, de-icers, paint surface treatment agents, alcohol, and vinegar.
 - If organic cleaners may be present when cleaning the equipment or performing related operations, please protect the cover lens to prevent any contact with organic cleaners.
- Do NOT apply excessive force to the lidar, as this can damage the cover lens.
 - If a pressure washer is used to clean the cover lens, make sure the distance between the nozzle and the cover lens remains at least 60 cm.
 - Using automatic cleaning devices that are not specifically designed for lidars may pose risks. Please contact Hesai technical support for assessment.
 - Do NOT use sharp objects (such as knives or metal tweezers) or hard brushes (such as stiff nylon brushes or wire brushes) to scratch the cover lens cover surface. Such actions may damage the cover lens surface, and in severe cases, may cause malfunction.
- After prolonged exposure to strong sunlight and high temperatures, the cover lens should NOT be cleaned immediately.
- If snow or ice accumulates on the cover lens, do NOT use a pressure washer or ice scraper.
 - A small broom is recommended to remove snow.
 - A solvent-free (i.e., free of organic solvents) ice removal spray is recommended to remove ice; alternatively, wait for the ice to melt by itself.
- Do NOT wax the cover lens.

Please regularly check on the cover lens, considering your use frequency, storage environment, and climate conditions.

- If foreign objects (such as dust, fingerprints, or oil stains) are found on the cover lens, make sure to clean them.
- If corrosive foreign objects (such as insect remains, bird droppings, tree resin, road dust, industrial dust, asphalt, soot particles, and road salt) are found on the cover lens, make sure to clean them immediately.

Cleaning procedure

1. Make sure the lidar is powered OFF.
2. Choose an appropriate cleaning agent:
 - For light stains, use room temperature water.
 - For heavier stains, use a mild soap solution (no more than two tablespoons of soap per quart or liter of water).
 - For stubborn stains, use a solvent-free (i.e., free of organic solvents), pH-neutral detergent at room temperature, such as car shampoo.
3. Take a clean soft sponge or anti-static microfiber cloth, dampen it with the chosen cleaning agent, and gently wipe the dirty area on the cover lens back and forth.
4. For stubborn stains, cover the dirty area with the dampened sponge or cloth to soften the stains before wiping.
5. Immediately after removing the stains, rinse the cover lens with clean water. Then, use a clean soft sponge or microfiber cloth to gently wipe away any remaining liquid (which may contain residual cleaning agents or contaminants).

6. Troubleshooting

If the following procedures cannot solve your problem, please contact Hesai technical support.

Symptoms	Points to check
Indicator light is off on the connection box.	Make sure that the following conditions are met: • The power adapter is properly connected and in good condition. • The connection box is intact. • The input voltage and input current satisfy the requirements in Section 2.3 Connection box (optional). Afterward, power on the lidar again and check if the symptom persists.
Motor is not running.	Make sure that the following conditions are met: • The power adapter is properly connected and in good condition. • The input voltage and input current satisfy the requirements in Section 1.5 Specifications. • The lidar can be accessed using Web Control (see Cannot open Web Control). • The lidar is not in standby mode; this can be confirmed using Web Control or PTC commands. • If a connection box is used, the connection box is intact. Afterward, power on the lidar again and check if the symptom persists.
Motor is running, but no output data is received, neither by Wireshark nor by PandarView 2.	Make sure that the following conditions are met: • The Ethernet cable is properly connected (by unplugging and plugging again). • Destination IP is correctly set; this can be confirmed using Web Control or PTC commands. • Firmware version is correct; this can be confirmed using Web Control or PTC commands. • Azimuth FOV is correctly set; this can be confirmed using Web Control or PTC commands. • The lidar is emitting laser light; this can be confirmed using an infrared camera, an infrared sensor card, or a phone camera without an infrared filter. Afterward, power on the lidar again and check if the symptom persists.

Symptoms	Points to check
Output data can be received by Wireshark but not by PandarView 2.	Make sure that the following conditions are met: • Lidar Destination Port is correctly set; this can be confirmed using Web Control or PTC commands. • If VLAN is enabled, the computer's VLAN ID should be the same as the lidar's; this can be checked using Web Control or PTC commands. • The computer's firewall for public networks is turned off, or PandarView 2 is added to firewall exceptions. • The latest PandarView 2 is installed (see Downloads page of Hesai's official website or contact Hesai technical support). Afterward, power on the lidar again and check if the symptom persists.
Cannot open Web Control.	Make sure that the following conditions are met: • Ethernet cable is properly connected (by unplugging and plugging again). • The lidar's IP is in the same subnet with the computer's (WireShark may be used to check the lidar's IP that broadcasts data packets). • If VLAN is enabled, the computer's VLAN ID should be the same as the lidar's; this can be checked using Web Control or PTC commands. Afterward, follow these steps: 1. Restart the computer or connect the lidar to another computer. 2. Power on the lidar again and check if the symptom persists.

Symptoms	Points to check
Point cloud is abnormal, showing obviously misaligned points, flashing points, or incomplete FOV.	Make sure that the following conditions are met: • The lidar's cover lens is clean. If not, refer to Section 5 Maintenance for the cleaning method. • The lidar's angle correction file is applied (refer to PandarView 2 User Manual). • Azimuth FOV is properly set; this can be confirmed using Web Control or PTC commands. • Spin Rate is steady; this can be confirmed either by checking the Motor Speed field (if available) in Point Cloud Data Packets, or by using Web Control, PandarView 2 or PTC commands. Afterward, check for packet loss. If no packet is lost yet the point cloud flashes, try these steps: 1. Update PandarView 2 to the latest version (see Downloads page of Hesai's official website or contact Hesai technical support). 2. Restart the computer. If the point cloud is still abnormal, try these steps: 1. Connect the lidar to another computer and another network. 2. Power on again and check if the symptom persists.
The number of data packets received is abnormal, indicating missing packets.	Make sure that the following conditions are met: • Azimuth FOV is properly set; this can be confirmed using Web Control or PTC commands. • Spin Rate is steady; this can be confirmed either by checking the Motor Speed field (if available) in Point Cloud Data Packets, or by using Web Control, PandarView 2 or PTC commands. • Ethernet is not overloaded. • No switch is connected to the network (the data transmitted from other devices may cause network congestion and packet loss). Afterward, follow these steps: 1. Connect the computer to no other devices but the lidar and check for packet loss. 2. Power on the lidar again and check if the symptom persists.

Symptoms	Points to check
GNSS cannot be locked.	Make sure that the following conditions are met: • GNSS receiver is properly connected. • PPS signal is connected to the lidar. • GNSS Destination Port is correctly set; this can be confirmed using Web Control or PTC commands. • The GNSS signals satisfy the electrical requirements in Section 2.2 Electrical interface and Section 2.3 Connection box (optional). Afterward, power on the lidar again and check if the symptom persists.

Appendix A: Channel distribution data

Notes to the table

Channel number	Counts from 1, top to bottom.
Angular position	The design values of each channel's horizontal (azimuth) angle offset and vertical (elevation) angle. - The accurate values are recorded in this lidar unit's angle correction file. - To analyze point cloud data, refer to Section 3.1.4 Point cloud data analysis method.
Instrumented range	Actual measurement range, confined by the allocated Time of Flight (ToF) for each channel
Near- and mid-field enabled	The 32 channels with min. instrumented range = 0.3 m are near-field-enabled channels. - All channels fire laser pulses that detect far-field objects (> 2.7 m). Additionally, the near-field-enabled channels also fire laser pulses that only detect the near-field objects (0.3 to 2.85 m) at times separate from these channels' far-field firings. - The horizontal resolution of near-field measurement is always 0.4° at 10 Hz and 0.8° at 20 Hz.
Max. range @10% reflectivity	- Probability of Detection (PoD) = 70% - The values in brackets only indicate ranging capability, while the actual measurement range is cut off to max. instrumented range. - Channels 98 to 128 only provide near- and mid-field detection, because these channels typically point to the ground.
Far-field enhanced	Channels 34 to 65 are far-field-enhanced channels , able to detect 200 m @10% reflectivity (see data in max. range @10% reflectivity).

Min. detectable reflectivity at max. instrumented range

Probability of Detection (PoD) = 70%

High-resolution

Channels 26 to 90 are high-res channels, characterized by

- 0.125° vertical resolution
- enhanced horizontal resolution in High Resolution Mode (see [Section 4.4 High Resolution](#))

Channel No.	Angular position		Instrumented range		Near-field enabled?	Max. range @10% reflectivity	Far-field enhanced ?	Min. detectable reflectivity at max. instrumented range	High-res?

Appendix B: Absolute time of point cloud data

B.1. Source of absolute time

The lidar retrieves the current absolute time by connecting to an external clock source.

B.1.1. GNSS as the clock source

The lidar connects to a third-party GNSS module to obtain pulse-per-second (PPS) signals and NMEA sentences.

- Each rising edge of the lidar's internal 1 Hz signal triggers a GNSS Data Packet. The data format is detailed in [Section 3.2 GNSS Data Packet](#).
- The timing requirements of PPS and NMEA are shown in [Section 2.2.1 Pin description](#).

The absolute time is updated as follows:

NMEA status	Date and time (accurate to the second)	Lidar behavior
Unlocked (Initial)	Virtual	Because the lidar has not been locked before, it starts counting from a virtual UTC (such as 2000-01-01 00:00:00) using the lidar's internal 1 Hz signal.
Locked	Synchronized	At each rising edge of the internal 1 Hz signal, the lidar obtains the actual date and time by performing these two steps: 1. Extract the date and time from the previous NMEA message. 2. Add 1 full second.
Unlocked (Lost)	Drifting	When the lidar goes from Locked to Unlocked, it starts counting from the last synchronized time using the lidar's internal 1 Hz signal. This absolute time will gradually drift from the actual GNSS time.

PPS status	μ s time	Lidar behavior
Unlocked (Initial)	Not synchronized	The lidar's internal 1 Hz signal is not aligned with the GNSS second.

PPS status	μ s time	Lidar behavior
Locked	Synchronized	The rising edge of the lidar's internal 1 Hz signal is aligned with the rising edge of the PPS signal (i.e. the start of each GNSS second).
Unlocked (Lost)	Drifting	The lidar counts the absolute time using the internal 1 Hz signal. This absolute time will gradually drift from the actual GNSS second.

B.1.2. PTP as the clock source

The lidar connects to a third-party PTP master to obtain PTP signal.

- PPS signal is not required nor used.
- PTP can be configured using Web Control or PTC commands.
- The status of PTP signal can be found using Web Control or PTC commands.
- The lidar does not output GNSS Data Packets.

The absolute time is updated as follows:

PTP status	Date and time (accurate to the microsecond)	Lidar behavior
Free run	Virtual	Because the lidar has not been locked before, it starts counting from a virtual UTC (such as 2000-01-01 00:00:00) using the lidar's internal 1 Hz signal.
Tracking or Locked	Synchronized	The lidar extracts the actual date and time from the PTP master's messages.
Frozen	Drifting	When the lidar goes from Tracking/Locked to Frozen, it starts counting from the last synchronized time using the lidar's internal 1 Hz signal. This absolute time will gradually drift from the actual PTP time.

- PTP is a Plug & Play protocol; the lidar works as a PTP slave device and requires no additional setup.
- The **Timestamp** and **Date & Time** fields in Point Cloud Data Packets strictly follow the PTP master device. Certain PTP master devices

may have a specified offset from the lidar's time output. Please verify the configuration and calibration of your PTP master device.

B.2. Absolute time of the Point Cloud Data Packets

The absolute time of a Point Cloud Data Packet is $t_0 = t_s + t_{ms}$, where:

- t_s is the whole second part (see the **Date & Time** field).
- t_{ms} is the microsecond part (see the **Timestamp** field).

The definition of the above fields is in [Section 3.1.2.5 Tail](#).

B.3. Start time of each block

Given the absolute time of this Point Cloud Data Packet as t_0 , the start time of each block $t(m)$ can be calculated.

At each $t(m)$, the lidar saves the current azimuth into the current block's Azimuth field in the Point Cloud Data Packet; see [Section 3.1.2.3 Body](#).

(Unit: μs)

Single Return mode

Block	Start time $t(m)$ in High Resolution mode	Start time $t(m)$ in Standard mode
Block 1	$t_0 + 3.148 - 27.778$	$t_0 + 3.148 - 27.778 \times 2$
Block 2	$t_0 + 3.148$	$t_0 + 3.148$

High Resolution mode and Standard mode are defined in [Section 4.4 High Resolution](#).

Dual Return mode

Block	Start time $t(m)$
Block 1 & Block 2	$t_0 + 3.148$

B.4. Laser firing time of each channel

In Block m , the absolute firing time of Channel n is:

$$t(m, n) = t(m) + \Delta t(n)$$

Steps to look up firing time offsets $\Delta t(n)$

1. Check the **Operational State** field in the [Tail](#) of the Point Cloud Data Packet.
Operation States: High Resolution, Standard, Energy Saving, Shutdown
2. Check the **Azimuth State** field in the [Tail](#) of the Point Cloud Data Packet, and obtain the azimuth state of Block m .
 - Range in High Resolution mode: 0, 1, 2, 3
 - Range in Standard or Energy Saving mode: 0, 1
3. Check the **Distance** field of Channel n in Block m , in the [Body](#) of the Point Cloud Data Packet.
 - If object distance > 2.85 m, the data point is generated from a far-field firing.
 - If object distance ≤ 2.85 m, the data point is generated from a near-field firing.
4. Look up $\Delta t(n)$ in the tables below
Unit: ns

In the ascending order of channel number

Operational State	High Resolution								Standard or Energy-Saving			
Azimuth State	0		1		2		3		0		1

Appendix C: Nonlinear reflectivity mapping

By default, the **Reflectivity** field in Point Cloud Data Packets (see [Section 3.1.2.3 Body](#)) linearly represents target reflectivity.

Alternatively, users may choose the Nonlinear Mapping mode using Web Control or PTC commands.

C.1. Nonlinear Mapping 1#

This mapping increases the contrast in the low-reflectivity region.

Figure 27. Nonlinear mapping 1#

Nonlinear mapping 1#

C.2. Nonlinear mapping 2#

This mapping increases the resolution of low-reflectivity objects, especially lane markings.

Figure 28. Nonlinear mapping 2#
